

## TSIS 4 — Team Competencies

Project: Student Marketplace | Group: 4 | Project Manager: Yeszhanov Aliaskar

# 1. Team

| Member             | Role                 | Main Responsibility                                                                         |
|--------------------|----------------------|---------------------------------------------------------------------------------------------|
| Yeszhanov Aliaskar | Project Manager (PM) | Project scope, planning, team coordination, reporting, and course artifacts                 |
| Zhakanov Bolat     | Developer (DEV)      | Project architecture, frontend/backend implementation, authentication, listings, and search |
| Khamitov Aibar     | UX Designer (UX)     | User needs, wireframes, interface design, and usability                                     |
| Madeniyetov Azamat | QA                   | MVP testing, bug identification, and quality control                                        |

These roles follow the RACI matrix from TSIS 1+2, where the DEV is responsible for repository setup, architecture, and core feature implementation, UX is responsible for wireframes and the prototype, QA is accountable for testing, and PM is responsible for scope, documentation, and course artifacts.

# 2. Required Competencies

| Competency                          | Required Level | Why                                                                                                                     |
|-------------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------|
| Git / GitHub collaboration          | Intermediate   | The team uses a shared GitHub repository and needs branches, commits, pull requests, and organized collaboration.       |
| Web application architecture        | Intermediate   | The project needs a clear frontend/backend structure before active MVP implementation.                                  |
| Backend development & REST API      | Intermediate   | Registration/login, product listings, categories, search, and seller-related functions require backend logic and APIs.  |
| Database & data modeling            | Intermediate   | The system must store users, product listings, categories, prices, descriptions, and other marketplace data.            |
| UI/UX design & wireframing          | Intermediate   | Buyers and sellers need a simple interface for browsing products, creating listings, searching, and contacting sellers. |
| Software testing & bug tracking     | Intermediate   | The MVP must be tested and bugs must be fixed before the final demo and submission.                                     |
| Project planning & weekly reporting | Intermediate   | The team must organize work, track progress, report blockers, and prepare course artifacts.                             |
| Team communication & coordination   | Intermediate   | PM, DEV, UX, and QA need to coordinate dependencies and keep implementation aligned with the MVP scope.                 |

The competencies are directly connected to the Student Marketplace MVP, which includes registration and login, product listing creation, categories, search and filtering, product details, seller contact, and basic listing management.

# 3. Current Competency Levels

| Competency                   | Yeszhanov Aliaskar (PM) | Zhakanov Bolat (DEV) | Khamitov Aibar (UX) | Madeniyetov Azamat (QA) |
|------------------------------|-------------------------|----------------------|---------------------|-------------------------|
| Git / GitHub collaboration   | Intermediate            | Intermediate         | Intermediate        | Intermediate            |
| Web application architecture | Beginner                | Intermediate         | Beginner            | Beginner                |

|                                     |              |              |              |              |
|-------------------------------------|--------------|--------------|--------------|--------------|
| Backend development & REST API      | Beginner     | Intermediate | —            | Beginner     |
| Database & data modeling            | Beginner     | Intermediate | —            | Intermediate |
| UI/UX design & wireframing          | Beginner     | Beginner     | Intermediate | -            |
| Software testing & bug tracking     | Beginner     | Beginner     | Beginner     | Intermediate |
| Project planning & weekly reporting | Intermediate | Beginner     | Intermediate | Beginner     |
| Team communication & coordination   | Intermediate | Intermediate | Intermediate | Intermediate |

The competency levels above reflect the actual team information provided for this assignment: Aliaskar has intermediate project-management skills and Intermediate Git skills, Bolat has intermediate coding skills, Aibar has intermediate Figma/UX skills, and Azamat has intermediate testing skills.

## 4. Gaps & Actions

- **Web application architecture:** the required level is Intermediate. Bolat has the strongest related technical competency and will define the initial frontend/backend structure and explain it to the PM and QA by the end of Week 5.
- **Database & data modeling:** the required level is Intermediate, and Bolat will take the main responsibility for preparing the first data model for users, listings, and categories. Azamat will review it from the testing perspective during Week 5.
- **Git / GitHub collaboration:** Aliaskar has Intermediate Git skills, while Aibar and Azamat are at Beginner level. Aliaskar will prepare a short team workflow for branches, commits, and pull requests and help both members practice it before active feature development in Week 5.
- **Software testing & bug tracking:** Azamat has Intermediate testing skills, while other team members are at Beginner level. Azamat will prepare a basic test checklist for registration/login and product listing flows and review it with the team by the end of Week 5.
- **Project planning & coordination:** Aliaskar has Intermediate PM skills, but the rest of the team has less experience with planning and reporting. Aliaskar will continue assigning development tasks, tracking blockers, and updating the weekly report throughout Week 5.

These actions also follow the situation described in TSIS 3: the repository was created and the workspace was prepared, but backend implementation had not yet started, so the next step was to define backend architecture and begin implementation.

## 5. AI Disclosure

**AI Disclosure.** Generative AI was used to help structure the competency matrix and improve the English wording. Project information, team roles, previous project decisions, and competency levels were provided or reviewed by the team.
